

Critical Analysis of the NSW Fair Trading Website

<https://www.nsw.gov.au/departments-and-agencies/fair-trading>

Student Name: Kapil Vinayak

Student Number: z5646894

Tutor Name: Nathaniel Tan

Tutorial Time: Tuesday, 5 to 7 pm

Course: Human Computer Interaction

Assignment: User Interface Analysis & Critique

Date: 11/03/26

1 Introduction:

NSW Fair Trading is a government agency located in New South Wales that is offering information, services and support regarding consumer protection and regulation of the marketplace. The site is an official online source that provides people and companies with access to legal advice, complaints, dispute management, and awareness of their rights and responsibilities in the law of NSW.

The main goal of the site is to:

- Guarantees consumers good business conduct.
- Offer the data on rights to tenancy and rent legislation.
- Control businesses, tradespersons and building licences.
- Provision of dispute resolution services.
- Make forms, applications and compliance requirements available.

The site is heavy content-based, policy-based and geared towards serving many users, that is, tenants, landlords, business owners, home buyers and vulnerable people who need legal or consumer advice. It aims to ensure that legal and regulatory information is available, understandable, and implementable to the citizens.

2 Analysis of the design and visual design principles in an issue table:

Issue table

Ref.	Severity	+/-	Principle	Description	Effects on the usability goals	Effects on the user experience goals	Screenshot	Improvement
1	Medium	Positive	Visibility (Design Principles)	The search bar is prominently located at the top of the homepage	Efficiency	Helpful	Image 1	None needed
2	Low	Positive	Recognition rather than recall (Heuristics)	Navigation menu clearly lists sections like "Consumer Rights," "Tenancy," and "Complaints"	Efficiency	Enjoyable	Image 2	None needed
3	Medium	Positive	Flexibility and Efficiency of use(Heuristics)	Quick links such as "Lodge a Complaint" or "Report an Issue" allow users to access tasks directly	Utility	Satisfying	Image 3	None needed
4	Low	Positive	Consistency (Design Principles)	All pages have consistent headers, menus, and color schemes	Memorability	Helpful	Image 4	None needed
5	Medium	Positive	Structure (Design Principles)	Subsections are logically grouped under main topics, making navigation predictable	Learnability	Helpful	Image 5	None needed
6	Low	Positive	Feedback (Heuristics)	Form submissions display clear confirmation messages	Effectiveness	Reassuring	Image 6	None needed
7	Low	Positive	Accessibility (Visual Design Principles)	Text size and contrast are readable on most devices	Efficiency	Comfortable	Image 7	None needed
8	Medium	Positive	Error Prevention (Heuristics)	Mandatory fields in forms are clearly marked	Learnability	Helpful	Image 8	None needed
9	High	Negative	Visibility (Design Principles)	Important links like "Dispute Resolution Forms" are buried at the bottom	Effectiveness	Annoying and Frustrating	Image 9	Move important links higher and highlight them with icons or color
10	Medium	Negative	Structure (Design Principles)	Some submenus require scrolling or multiple clicks to find information	Efficiency	Annoying and Frustrating	Image 10	Use collapsible menus or a sidebar to make sections immediately visible
11	Medium	Negative	Aesthetic and minimalist design (Heuristics)	Some pages are very text-heavy with minimal spacing, which can overwhelm users	Learnability	Overwhelming	Image 11	Break content into sections, headings, bullet points, and more white space
12	Low	Negative	Error Prevention (Heuristics)	Forms do not provide inline warnings when a required field is missed	Learnability	Annoying/Frustrating	Image 12	Add inline validation with clear error messages next to fields
13	Medium	Negative	Visibility (Design Principles)	Some icons (e.g., login, account) are small and easy to miss	Efficiency	Frustrating	Image 13	Increase icon size and use contrasting colors to make them noticeable

14	Medium	Negative	Flexibility and Efficiency (Heuristics)	No shortcut links for frequent tasks like checking tenancy rights or lodging complaints	Efficiency	Frustrating	Image 14	Add a "Frequently Used" section or shortcuts on the homepage
15	Low	Negative	Consistency (Design Principles)	Some pages have slightly different button styles or colors	Memorability	Confusing	Image 15	Standardize button style and color across all pages
16	Medium	Negative	Feedback (Heuristics)	Pages with long forms don't give progress indicators	Effectiveness	Frustrating	Image 16	Add a progress bar for multi-step forms

3 Analysis of the Design and Visual Design Principles in Detail

Issue 1: Vital connections Found at the Bottom of the Page.

Among the issues noticed on the site is that some of the links that are important e.g. dispute resolution or refund information appear at the very bottom of long pages. This is against the Visibility design principle which stipulates that significant features of a system must be seen by users with ease.

Users who access a government site like this one are normally in need of certain information within a short time e.g. how a problem can be reported or assistance sought. When the significant connections are placed at the bottom of a page, the users will have to scroll through vast pages to locate them. This decreases the efficiency, and this is one of the major usability objectives. It can have negative impact on effectiveness, as well, as some users would get lost in the information at all.

This may cause frustration to users where users already have legal or consumer issues may experience frustration. The visitors may be inclined to think that the site is hard to use and leave the page without doing their business.

Proposed Solution:

The top navigation or quick-access bar of the site should have important links like the help, returns, or dispute resolution. This would enhance visibility and enable the users to find and access essential services without scrolling through too much information

Issue 2: Searching Takes More than One Click to Find.

One more problem is that there are certain information on the site which necessitates the user to navigate through several layers of navigation to find the required information. This is connected to the principle of Structure design and Flexibility and Efficiency of Use heuristic.

A proper interface must enable people to achieve their objectives by taking the minimal steps. Using multiple clicks to land on and navigate through a number of pages or menus to get simple information slows down the interaction and reduces efficiency.

Indicatively, when a user is seeking tenancy information he or she may be prompted to follow multiple layers of menu before he/she accesses the specific information required. This makes the user put more mental strain on the use and can be confusing particularly to users who are not conversant with the site.

This may make the site seem tricky and daunting to the user.

Proposed Solution:

The site needs to present collapsing menus or side bars that will allow the user to view all the important sections at once. Also, the quick links on the home page should have the frequently visited topics.

Issue 3: Lots of Text on Pages.

The website has numerous pages with huge blocks of text, and very small amounts of visual differentiation. The violation of Aesthetic and Minimalist Design heuristic and visual design principles of white space and layout of this issue.

Government sites are well detailed but usually give the information in a big block of text which complicates the reading and comprehension of the information by the users. The users might not be able to find the desired information in the dense paragraphs.

This impacts adversely on the usability objective of learnability since users have to waste more time learning the structure of the content. It decreases efficiency also, as users have to scan long pieces of text.

A user experience point of view is that text heavy pages can be intimidating and tiresome to read, and thus the user may give up.

Proposed Solution:

Headings, bullet points and short paragraphs should be used to divide the content in small bits. Some more white space and visual differentiation would allow making the content easy to scan and comprehend.

Problem 4: There is No Immediate Feedback of Error in Forms.

The other problem is some online forms do not display the error messages until the user has entered the form. This goes against the Error Prevention heuristic and Feedback principle.

The immediate feedback allows the users to have instant feedback when filling in forms when they make errors. In case the site merely shows errors upon submission, one will be forced to backtrack and locate the information missed independently. This adds the additional work to do the task.

This has a demeriting impact on the usability objective of learnability in the sense that users would have to establish what went wrong without adequate instructions. It also reduces efficiency, because the users can have to fill in the form more than once to figure out how to do so correctly.

User experience wise, when the error message takes time to load, it can be irritating and users can give up on the form.

Proposed Solution:

The site ought to have real time validation whereby error messages are displayed instantly whenever users fill wrong or incomplete information. This assists users to rectify errors in the short time and enhances the general experience.

Problem 5: Minimization of small icons in the Navigation Bar.

There are some icons in the navigation bar that are quite small and not much to be noticed. This is contrary to the principle of the Visibility design and the principle of contrast in visual design.

Small icons or low contrast icons may not be easily recognized by the user, particularly those with poor eyesight or mobile users. When the users are not able to realize that there are some important functions, but they can not easily identify these icons.

This lowers efficiency because the users would take longer time to find functionalities like account access or help pages.

With regard to a user experience, small or ambiguous icons may cause the interface to seem ill-designed and hard to use.

Proposed Solution:

Strong colour contrast should be used and make them to be bigger to make icons more visible. The icons should also be clearly labelled so that the user can know what the icon does.

Problem 6: Absence of Shortcut Links to Frequent activities.

The fact that there are no shortcut links to commonly used operations, like checking tenancy rights and making a complaint is another problem. This is in breach of Flexibility and Efficiency of Use heuristic.

The websites intended to benefit the populace must accommodate the beginners and the seasoned users. There are no shortcut options and therefore a user has to navigate through several pages even when he/she is very sure of what is required.

This has a negative effect on the usability objective of efficiency, especially to returning customers who frequent the site.

The site might appear sluggish and uncomfortable to the user.

Proposed Solution:

The homepage should add a section called Frequently used services as well as Popular tasks. This would enable the users to find the regular services without using numerous pages.

Problem 7: Irregular Buttons on Different Pages.

There are also pages that have slightly coloured or different buttons. This is the violation of the Consistency design principle.

Coherence is essential as it does allow users to familiarize themselves with the interface. In cases where the appearance of buttons differs on different pages, the user can question whether they do different things.

This impacts the usability purpose of memorability because users are not able to count on familiar visual patterns.

In the user experience point of view, inconsistent design may make the site appear less professional and even a bit confusing.

Proposed Solution:

The site needs to take a standard design system in which all the buttons in the site have the same colour scheme, size and style.

Problem 8: The absence of the indicators of progress in multi-step forms.

Certain long forms fail to indicate to the users the number of steps left to complete. This is a breach of Feedback heuristic.

Users are likely to be confused on whether to continue or not when they are not sure how much time a task will require. Such information deficiency minimizes performance, as users can leave the form without filling it in.

On the user experience side, it may take up more time and be more frustrating since there is no indication of progress.

Proposed Solution:

The multi-step forms are to have a progress bar or step indicator, which will inform the user of the progress and the number of remaining steps.

4 Summing up

This assessment examined the NSW Fair Trading site through the usability principles, heuristic principles, and the use of visual design principles on the user interface of the site. This analysis was done with the objective of finding positive and negative features of the interface and how they influence usability objectives and user experience.

The analysis revealed that the site possesses a number of good design aspects which assist the users in accomplishing their tasks. To illustrate, the site has an obvious search engine, distinct categories of navigation, and a similar layout of the pages. These elements adhere to significant design principles including visibility, recognition as opposed to recall and consistency. They, therefore, contribute to the enhancement of usability objectives like

efficiency, memorability and learnability that play a part in making user experience supportive and fulfilling.

Nevertheless, the analysis also revealed a number of usability and visual design problems that might complicate the access of the users to the site. Relevant links are placed at the bottom of pages, big masses of text with scanty visual spacing, small navigation buttons, and absence of shortcut links on services used frequently are some of the key issues. Moreover, other types lack instant feedback or a sense of progress, and this may disorient a user when completing a task.

These problems are primarily against the principles of usability that include: visibility, flexibility and ease of use, aesthetics and minimalism, error prevention, and consistency. Simultaneously, such principles may minimize such usability goals as efficiency, learnability, and effectiveness whenever they are not implemented appropriately. This may in turn contribute to bad user experiences such as frustration, confusion or failure to accomplish tasks.

A number of recommendations were made to solve these problems. These involve relocating essential links, positioning the pages in a better manner with a better spacing and the headings, enhancing the visibility of the icons, incorporating shortcut links to frequently used tasks, and ensuring that the forms have real time validation schemes with indicators. All these enhancements would help in making the site user-friendly and more accessible to more people.

In general, the NSW Fair Trading site is a good source of information and services to the population, nevertheless, the website can be optimized in terms of usability and appearance. With all the problems being resolved, the site can become an effective experience that will provide all users with an easier, more convenient, and more fulfilling experience, even if they are not accustomed to government websites or have poor digital skills.

5 Analysis of Accessibility

The issue of accessibility is also a crucial point of user interface design since the websites are meant to be accessed by individuals possessing varying abilities and such abilities may include persons with impaired vision, colour blindness or other disabilities. This should be especially true of the government websites which should be able to make important services and information accessible to all. In the process of evaluating the NSW Fair Trading web site, two problems relating to access were found.

Issue 1: Accessibility1: Colour Contrast might not be easy to all users.

Accessibility issues that one is concerned with include that certain sections of the site have colour schemes that do not give sufficient contrast between text and background colours. This may complicate the process of people with eye problems or colour blindness reading the content at ease.

Accessibility guidelines, like the Web Content Accessibility Guidelines (WCAG) insist and maintain that text must have a high enough contrast with its backdrop to be readable. In case of low contrast, users might not be able to see the text and background easily particularly when using mobile devices or using the site during varying lighting conditions.

This problem can have a serious impact on the workability of the site by those who are visually impaired as they can not read the instructions and other significant information clearly. Due to this, the site will become less user-friendly and some users may not be able to fulfil crucial functions including making a complaint or consult consumer rights information.

Proposed Solution:

The site must be designed to comply with WCAG standards of contrast between text and background colours. You can also enhance readability by increasing colour contrast and darker reading on lighter backgrounds which can significantly enhance the readability level by users with visual impairment or colour blindness.

Issue 2: Lack of Alternative Text of images and Icons on Accessibility.

The other aspect of accessibility is associated with the utilization of images and icons on the site which are not necessarily accompanied by elaborated alternative text (alt text). The importance of the use of alternative text is that it enables the screen readers to explain images to the blind people, or individuals with acute visual impairments.

When there is no descriptive alt text accompanying the images or icons, users who use screen readers will fail to get the important information or they cannot understand the intention of the specific visual representations. To give an example, the assistive technologies might not make use of icons that are used to represent the categories of services or navigation.

This impacts the usability aim of accessibility and learnability since users relying on the services of a screen reader are unable to perceive the structure and the content of the page with ease. It also has negative impacts on the user experience since the visually impaired one might feel that he or she is not included or can interact with the site.

Proposed Solution:

Every picture, icon and the visual must have a descriptive alt text, which clearly states the purpose or the message of it. This makes sure that the screen readers will be useful to convey the information to users whose assistance technology is necessary.

6 Analysis of Adaptive Interface Design

Problem 1: Navigation Menu becomes challenging to use with small screens.

On mobile devices, the primary navigation menu is reduced to a smaller icon of a menu. Although this is a usual responsive design method, some users might struggle to find some areas since the menu conceals several options in several layers.

This impacts on usability objective of learnability as the first-time users might not know where to locate certain information, like tenancy rules or complaint services at once. In case the users do not grasp the navigation structure within a short time, it might confuse or make them waste more time in seeking information.

Proposed Solution:

The mobile navigation on the site ought to be simplified by giving more priority to the most accessed sections of the site like Consumer Rights, Tenancy, Complaints and licensing. Also, having a sticky navigation or quick-access buttons may be useful to allow the users to reach the important sections with ease and not to reopen the menu each time.

Problem 2: Buttons and links are hard to tap, which are small.

The other problem that is experienced when using smaller screens is that certain buttons and links are relatively small and they are situated closely together. This decreases the touch friendliness and makes it difficult to tap in a correct choice especially on mobile devices.

In cases where the size of buttons is too small or too close to each other, then the user will tap the wrong option. This reduces efficiency and can cause frustration to the user particularly those with low motor control and those using the site with smaller phones.

Proposed Solution:

The site ought to make the clickable buttons size bigger and spacing between links should be increased to enhance touching ability. The interface could be simplified and made more comfortable to use by following popular guidelines of mobile design (minimal touch target sizes).

Problem 3: Long Webpages take too much scrolling on Smartphones.

The website has some pages with a huge volume of text and information. In smaller displays, this makes very long pages that may take the user a long time to scroll before accessing some significant information.

Over scrolling will eventually be detrimental to the usability objective of efficiency since the user will have to waste more time browsing the page. It may also influence the aspect of learnability as the user might have difficulties in understanding the structure of the presentation when the information is dispersed over a lengthy page.

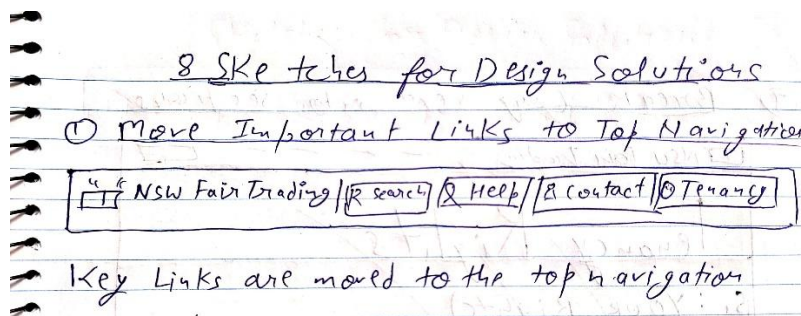

Proposed Solution:

The collapsible sections, tabs, or expandable menus should be used in reorganising the content. It enables users to be able to access the information they require promptly without the need to scroll down to the bottom of the page. It is also more readable on the mobile devices because the content is broken into smaller parts.

7 13 - Sketch your design solutions

Sketch 1: Move Important Links to the Top Navigation

Issue: The search of such crucial services as complaints or help is not reflected in the first place.

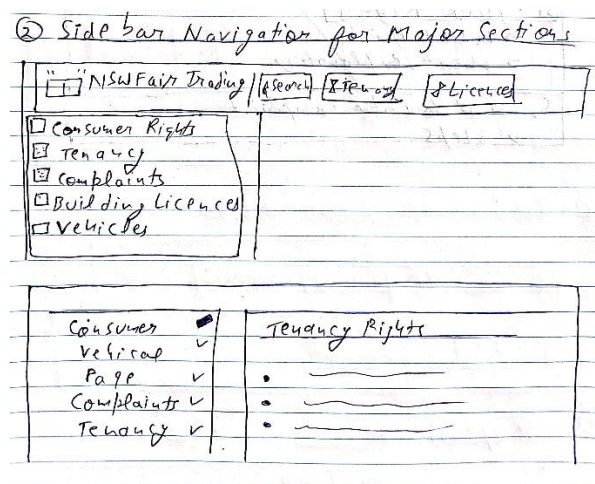

Annotation: The large links such as the Complaints and Tenancy, consumer rights are also found on the top navigation bar. Immediacy discernible by other icons.

Improvement: This improves the Visibility design and efficiency concept since the customers have the ability to scroll simultaneously to access the much needed services.

Sketch 2: Sidebar Navigation for Major Sections

Issue: one of the users will be obliged to waste time on the pages till he or she will find the information.

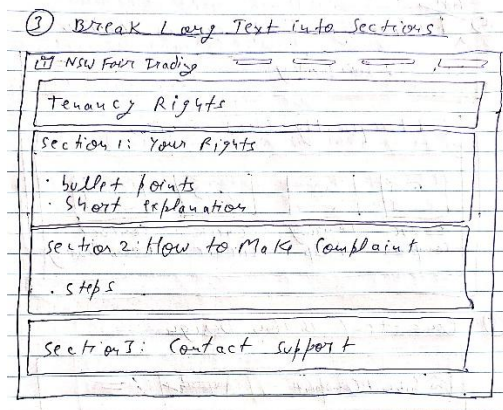

Annotation: Have left-side navigation menu. Sub-categories are large, and they are presented.

Improvement: Increases Design and Organization and usability due to the fact that the users can learn the site design within a low time.

Sketch 3: Break Long Text into Sections

Issue: pages are displayed with massive amounts of text.

Annotation:

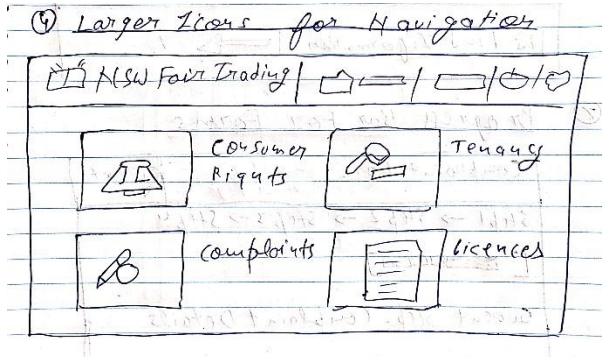

Long paragraphs with headings + bullets.

Add white space.

Improvement: Promotion of Learnability and Readability with preference of Aesthetic and Minimalist Design heuristic and augmentation.

Sketch 4: Larger Icons for Navigation

Issue: The icons of navigation are not huge and prominent.

Annotation:

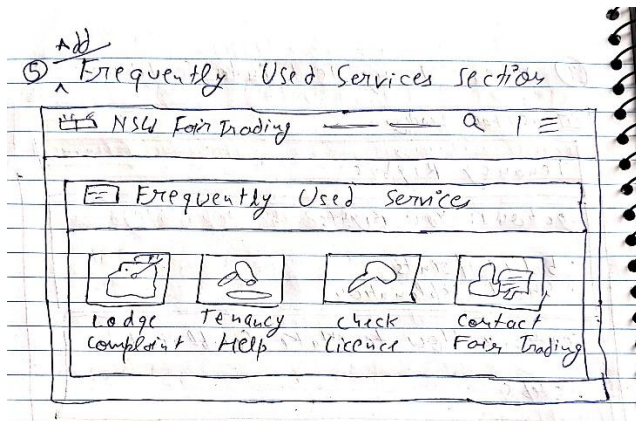

Use large icons with labels

Reduce the spacing between buttons.

Improvement: Increased Affordability and Visibility and a reduction in actions to be detected which leads to an increased Efficiency.

Sketch 5 – “Frequently Used Services” Section

Issue: The user will have to sift through various pages in an attempt to get routine activities.

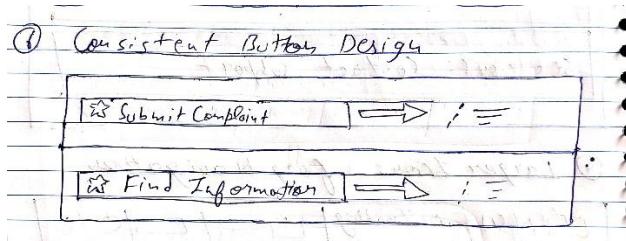

Annotation: Home page add shortcut links.

Improvement: Usability and Flexibility heuristic which will reduce the travelling time.

Sketch 6: Consistent Button Design

Issue: The pages have slight inconsistency in the usage of the buttons.

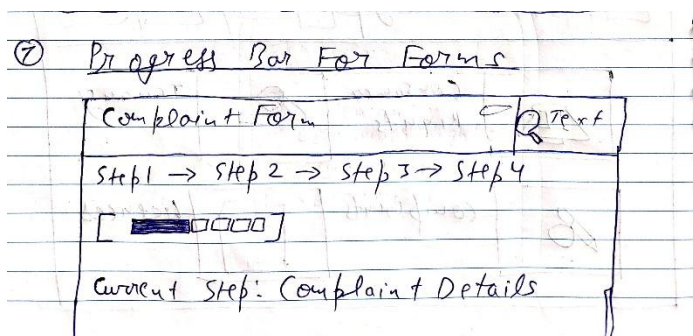

Annotation: Buttness-like, similar shaped and styled buttons of similar colour are employed.

Improvement: Improves the Consistency design principle which boosts Memorability and reduces confusion.

Sketch 7 – Progress Bar for Forms

Issue: Long forms do not show progress.

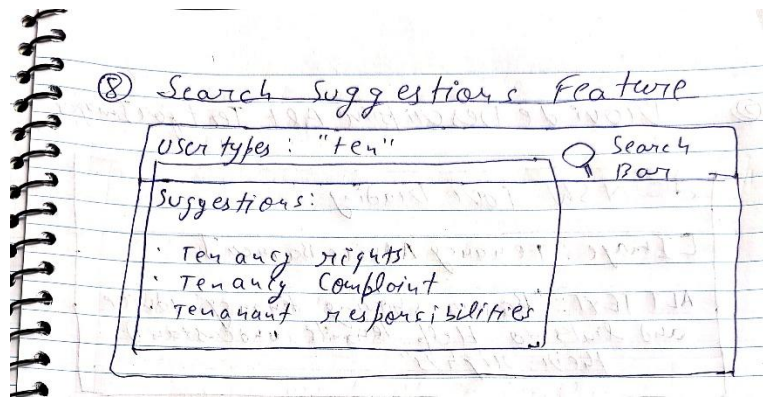

Annotation: Insert a progress meter (of the form of the top).

Improvement: Improves Feedback principle not painful and expecting.

Sketch 8 – Search Suggestions Feature

Issue: It may happen that the user does not know what to search.

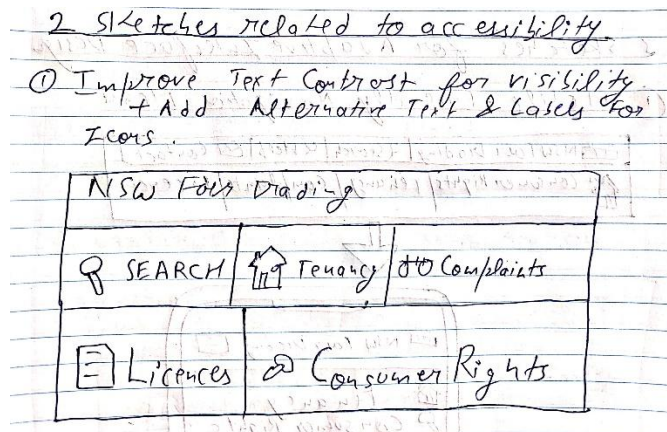

Annotation: The search box contains auto suggestion.

Improvement: It is heuristic following Recognition in comparison to Recall, and it enhances Efficiency and Learnability.

Sketch 1 – Drawings Select Alternative Icons Text and Labels.

Issue:

The buyers of the screen readers are not able to read all the icons and pictures appropriately.

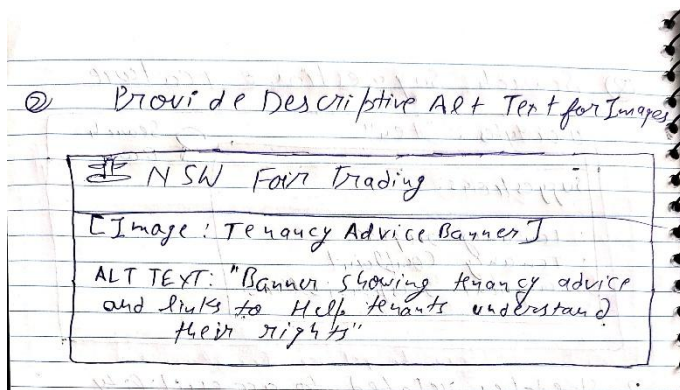

Annotation: It has the text labels, the labels are written below all the icons. The icons contain an alternate text (alt text) and that is read by the screen reader. The people who are blind to the icons can also interpret the functionality.

Improvement: This makes it more accessible and easier to read by the visually challenged who are the consumers of the screen readers.

It can also be applied to Recognition and not Recall heuristic in which the user does not need to make any guess towards being aware of the meaning of all the icons.

Sketch 2: Provide Descriptive Alt Text for Images

Issue: The images and icons on the site are not explained in a clear manner so that the users who access the site can decode the information on the site through the use of the screen readers hence, the site may not be interpreted easily by the users with the visual impairment.

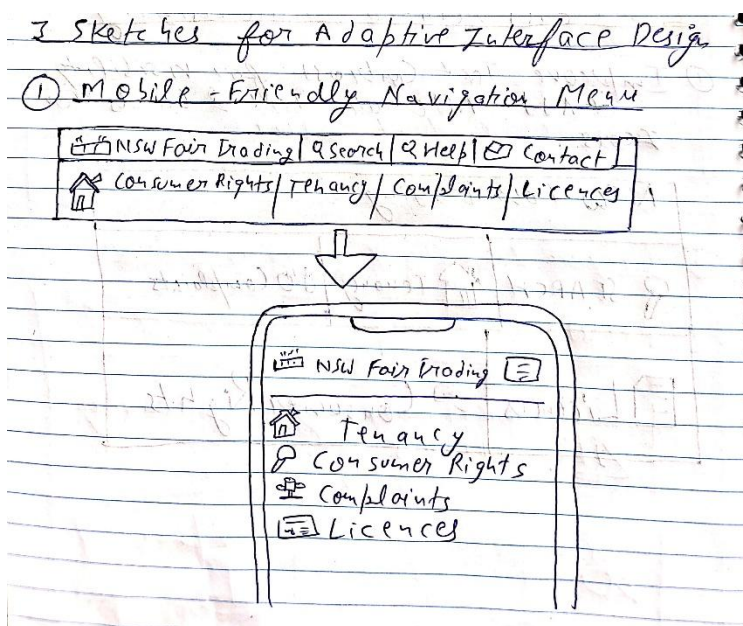

Annotation: Both of them contain the alternate text (alt text) description of the pictures. The screen readers are now able to read the information on the page aloud to the blind. It also has purpose of icons and banners text labels.

Sketch 1: Mobile-Friendly Navigation Menu

Issue:

The navigation menu will not be user friendly in smaller screen like the mobile phone as the various sections will be located at different levels of the menu.

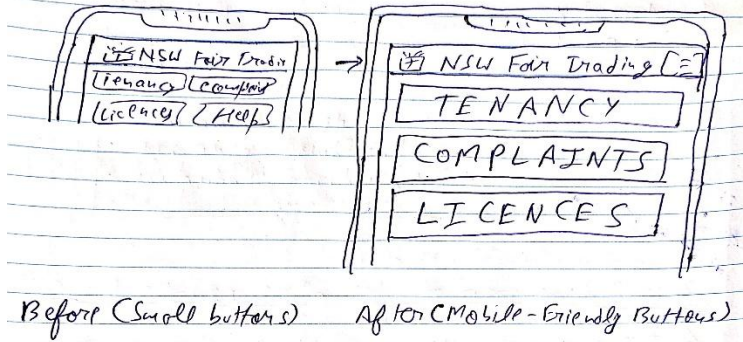

Annotation: Mobile screens have caused the conversion of the navigation menu into menus of hamburger (≡). The menu items are typed in large readable font as soon as it is opened.

Improvement: This will improve the adaptive interface that is responsive and learnable because the small size user will be pleased to scan through the areas of interest and does not need to scroll through many pages.

Sketch 2: Larger Touch-Friendly Buttons

Issue: The mobile screens have very few buttons and links that are not easily usable because they can hardly be tapped appropriately.

② Large Touch-Friendly Buttons

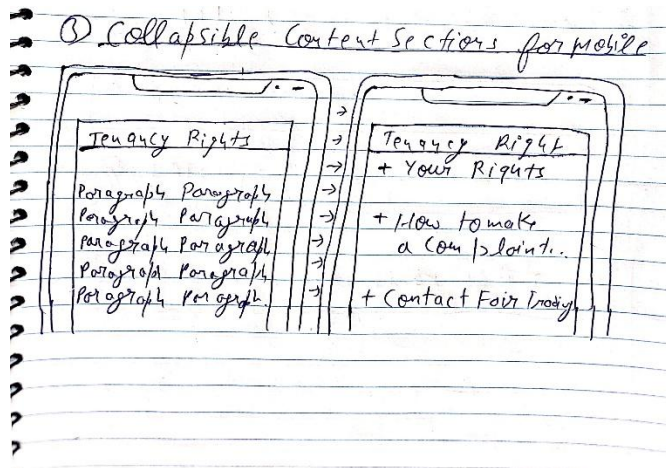

Annotation: Huge buttons and making a distance between the buttons greater. All the buttons appear covering the entire screen of the mobile.

Improvement: This renders it more approachable and effective upon an experience that touches as it is comparatively simpler to touch the mobile devices.

Sketch 3: Collapsible Content Sections for Mobile

Issue:

It will entail a lot of scrolling of little screens.

Annotation: The information is presented in tables and put in foldable accordions. The user is shown Taps on a part to reveal some information about it.

Improvement: This makes the designing interface unique and the performance and reduces scrolling down as well as encourages quick search of information that is needed by user when using the mobile devices.

Vehicle Complaint

Before you get started

Have you lodged a claim with a Tribunal or a Court regarding this matter?
If your complaint is not about the purchase of a motor vehicle, motor cycle, caravan or trailer or about parts or repairs for a vehicle, please lodge a [General Complaint](#).

☐ Yes

☐ No

 To enable Fair Trading to assess your matter please provide the following information (Where available):

- If you were unable to provide you vehicle details previously please provide the current Registration number, VIN number and odometer reading of your vehicle
- You may include a copy of the registration papers to assist with supplying this information
- Tax invoice / Proof of purchase / contract of sale for new or used motor vehicle (if relevant)
- Motor Dealers Notice or other documentation provided at the time of sale
- RMS Inspection Report, Service and Repair Tax Invoices
- Mechanical report detailing the current fault/s with the vehicle (if available)
- Extended Warranty Documentation (if relevant)

- When you are going to buy a new or used car, there are many things you should consider before you buy a vehicle.
- compare different vehicles and their features. Think about:
 - fuel efficiency
 - safety rating
 - price of maintenance and spare parts
 - cost of insuring vehicle
 - consider your needs for the vehicle and the operating costs involved
 - if you are buying an electric vehicle, take into account any [government rebates](#) when planning your budget. Additionally, think about how you might charge the vehicle.
 - always try to test drive a vehicle before you consider buying it

Know your rights

The buying and selling of new cars and other new vehicles in NSW is governed by the [Motor Dealers and Repairers Act 2013](#) (MDRA) and the [Australian Consumer Law](#) (ACL). Under each of these laws there are guarantees to protect you.

Dealer guarantees under the Motor Dealers and Repairers Act 2013

If something goes wrong with your new vehicle, you may be entitled to a remedy under the [dealer guarantees](#).

The dealer guarantees includes:

- a guarantee the vehicle is free from encumbrances and the buyer will have title of the vehicle
- the motor dealer guarantees to cover defects that occur after purchase
- a [compensation fund](#) to cover loss because the dealer did not meet its obligations and the loss cannot be recovered

The dealer guarantee applies to the following new vehicles:

- new vehicles
- new motorcycles

You can learn more about [dealer guarantees and warranties](#).

Manufacturer and extended warranties

Manufacturer and extended warranties are voluntary promises offered by the manufacturer, dealer or a third party.

For example, a dealer or manufacturer may offer a 5 or 7 year extended warranty for their new vehicles. These optional warranties may add to your automatic rights under the Australian Consumer Law.

Consumer guarantees under the Australian Consumer Law

The ACL also offers protections for consumers buying vehicles from dealers. Most vehicles sold through motor dealerships are covered by consumer guarantees that they must:

- be of acceptable quality (including that it is safe)
- be fit for any purpose disclosed before the sale
- match the description provided or demo model
- have spare parts and repair facilities available
- title possession and securities guarantee

Consumer guarantees are your automatic rights under the ACL. These cannot be restricted or excluded.

The Australian Competition and Consumer Commission (ACCC) has a [fact sheet](#) detailing your consumer rights when purchasing a new vehicle.

Manufacturers and dealers must honour your consumer guarantee rights regardless of any express or implied commercial warranties they give or sell to you.
